Note: This is the way to create a registry update file that will "fix" the QB desktop limitiation that requires

Internet Explorer 11 to run on Windows 10 and 11 which now don't have Internet Explorer.
Instructions:
        1 - copy the text that is within the "= = = =... ===" lines (do not copy the "= = =" lines!)
        2 - open Notepad and paste those lines into Notepad.
        3 - Click on "File" in "Notepad",
                click on "Save As"
                and then save it as as "Add IExplorer Path to Registry.reg" (or whatever you'd like to name it).
                Just make sure it has the ".reg" suffix!
        4 - the file should appear in File Explorer as a type of "Registration Entries" and not "Text Document".
                If it ends up showing "Text Document", you'll need to rename it to end with a ".reg" suffix
        5 - Click on the ".... .reg" file" and it will warn you that it is modifying the registry. You should select "ok" to install the "fix".
